

ABSTRACT

An improved organophotoreceptor comprises an electrically conductive substrate and a photoconductive element on the electrically conductive substrate, the photoconductive element comprising:

(a) a charge transport material having the formula

where X_1 and X_2 are, each independently, a linking group;

Ar comprises an aromatic group;

R_1 , R_2 , and R_3 comprise, each independently, H, an alkyl group, an alkenyl group, an alkynyl group, an aromatic group, or a heterocyclic group; and

n is a distribution of integers between 1 and 100,000 with an average value of greater than one; and

(b) a charge generating compound.

Corresponding electrophotographic apparatuses, imaging methods, and methods of forming the charge transport material are described.
